

Working assumptions, not forecasts. Capacity figures are scaled from a single Dutch reference case. Legal and regulatory entries were researched in September 2026, are not yet verified against primary sources, and will date. Generated 2026-09-05. [How this was built.](#)

Lithuania

Sovereign government data centre network — capacity, legal posture, provider landscape and migration path.

1 Starting point

Population	2.89 m
GDP	EUR 84 bn
Public administration (NACE O)	94 k
Electricity price	159.1 EUR/MWh
Renewables	49.0%
Live hyperscaler regions	0

2 What is structurally different

- Frontline exposure. A land border with Russia or Belarus (or a Black Sea coast facing the war) changes the threat model from *geopolitical supply disruption* to *kinetic and sabotage risk against the facilities themselves*. Defense and security workloads are scaled up 1.5x/1.25x in the baseline, and at least one site should be hardened (EMP/blast, autonomous power for weeks, not hours). A purely national footprint cannot provide the out-of-country cold copy that Estonia's Data Embassy already demonstrates; this is the first item to revisit when the EU federation layer (Dutch GOAL.md section 16) is modelled.
- No hyperscaler region in-country. Unlike the Netherlands, there is no commercial hyperscale tier to fall back on for non-critical workloads without leaving the jurisdiction. The sovereign core therefore has to be sized for a larger share of total government demand, and the hybrid model (Dutch GOAL.md section 7) needs a cross-border commercial tier.

3 Capacity

Servers	836 (CPU 584 / GPU 39 / storage 213)
IT critical load	1.4 MW
Facility design load	2.1 MW
Sites	3 (by capacity 1, floor 3)
Average per site	0.7 MW
Site count set by	the minimum-sites floor, not capacity
CAPEX	EUR 49 m
OPEX	EUR 5 m / yr

4 Proposed geography

Region	Role	Share	MW	Notes
Vilnius	Primary civil cloud	41%	0.8	KVTC state DCs, LIXP; 30 km from Belarus – hardened design mandatory.
Kaunas	Sovereign secondary	27%	0.6	Second metro, 100 km separation, KV Baltic campus.
Klaipeda	Government / continuity	23%	0.5	LNG terminal, NordBalt fibre to Sweden; furthest from Belarus.
Out-of-country reserve	Strategic reserve	10%	0.2	Follow the Estonian Data Embassy pattern – national-only model cannot close this gap.

First-pass geographic hypotheses encoding only the obvious constraints, to be replaced by scored site selection.

5 Legal and regulatory posture

Governing instrument	Law on the Management of State Information Resources
Cloud certification	No national scheme; ISO 27001
Data classification	Law on State and Official Secrets: Restricted / Confidential / Secret / Top Secret
Procurement route	CPO LT central purchasing organisation

Foreign jurisdiction exposure. No in-country region; Microsoft 365 in parts of administration

Under the US CLOUD Act and FISA 702 a provider subject to US jurisdiction can face a lawful order for data it holds regardless of where that data sits. Residency is necessary but not sufficient; what matters is who holds the keys and who can be compelled.

6 Current state and provider landscape

Government cloud	Valstybes debesija (State Cloud) – operated by KVTC under the Ministry of National Defence in state data centres
Maturity	operational
Digital identity	eID / Mobile-ID / Smart-ID
Interconnection	LIXP Vilnius/Kaunas; no own subsea (NordBalt fibre to SE)

7 Migration path and cost

Phase	Scope	MW	CAPEX	Cumulative	Hybrid
1	Sovereign core	0.5	EUR 9 m	19%	no
2	Security and defense	0.9	EUR 23 m	67%	no
3	State record	0.3	EUR 8 m	82%	no
4	Elective	0.3	EUR 9 m	100%	no

Phase 1 is the number that matters: **EUR 9 m** for 0.5 MW, 19% of total CAPEX. That is the floor below which no hybrid arrangement helps — and it is a small fraction of the full build.

8 Geography and threat notes

Between Kaliningrad and Belarus (Suwalki Gap) - highest frontline exposure; drone/GNSS incidents; no seismic; post-Ignalina electricity importer, Klaipeda LNG, Continental sync 2025; limited grid headroom for large loads
